#### MINISTERIO DE OBRAS PUBLICAS DIRECCION GENERAL DE AGUAS

DE : JAVIER NARBONA NARANJO

ING. JEFE DEPARTAMENTO DE HIDROLOGIA

# INFORMACION PLUVIOMETRICA, FLUVIOMETRICA, ESTADO DE EMBALSES Y AGUAS SUBTERRANEAS

### Contenido :

- 1.- Informe pluviométrico
- 2.- Volúmenes de embalses
- 3.- Informe fluviométrico
- 4.- Informe aguas subterráneas

En Internet (www.dga.cl) se publica: .

- -Los informes de este boletin
- -Caudales en tiempo real

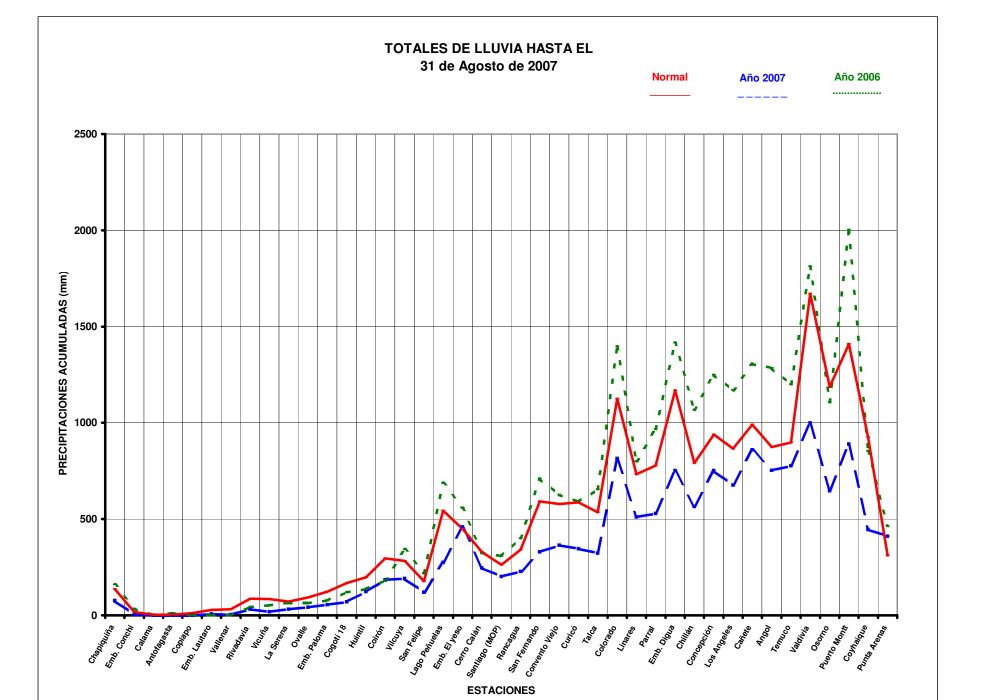

NOTA: Datos provisorios sujetos a modificaciones posteriores

# SITUACIÓN HIDROLÓGICA DEL MES DE AGOSTO DE 2007

#### LLUVIA

Las precipitaciones registradas durante el mes de agosto fueron escasas y los déficit existentes persistieron a lo largo del país, siendo más marcados desde la cuenca del Copiapó a la cuenca del Limarí a lo largo del litoral y valles centrales. Sin embargo en precordillera y en cordillera, especialmente de la III a la VI región, se alcanzaron valores iguales o superiores a los normales.

De la V región al sur, los déficit se mantienen entre un 20% y un 30%.

A esta altura del año, difícilmente se podrá revertir la situación deficitaria actual y, aún más, los pronósticos numéricos mantienen una tendencia al fenómeno de "La Niña" para el resto del año.

#### **NIEVE**

Las precipitaciones nivales por su parte, se extendieron desde la III región al sur en la alta cordillera y fueron abundantes, especialmente desde la III a la VI región donde superaron a las máximas medias anuales. En la VII y VIII región las acumulaciones presentan un déficit entre un 20% y un 50%.

| Región    | Nombre         | Acumulado a agosto | Máx. media anual |
|-----------|----------------|--------------------|------------------|
| IV-Elqui  | °C Olivares    | 250 mm             | 141 mm           |
| IV-Limarí | Quebrada Larga | 333 mm             | 206 mm           |
| IV-Limarí | °C Vega Negra  | 702 mm             | 528 mm           |
| V         | Portillo       | 725 mm             | 630 mm           |
| RM        | Farellones     | 483 mm             | 453 mm           |
| RM        | Laguna Negra   | 632 mm             | 566 mm           |
| VII       | Lo Aguirre     | 871 mm             | 1035 mm          |
| VIII      | Volcán Chillán | 503 mm             | 879 mm           |
| VIII      | Alto Mallines  | 764 mm             | n/c (nueva)      |

#### **CAUDALES**

De la III Región a la Región Metropolitana, los caudales presentan valores muy similares a los del mes anterior, siempre con valores bajo el promedio, pero sobre los mínimos históricos.

De la VI Región al sur los caudales experimentaron una disminución menor, siguiendo la tendencia histórica, ubicándose bajo los promedios pero siempre por sobre los mínimos históricos. Esta baja en los caudales se debe a que en este mes disminuyen las precipitaciones y aún no comienzan claramente los deshielos.

#### **EMBALSES**

El embalse Lautaro, de la Región III mantiene prácticamente el volumen acumulado al mes anterior con poco más de 7 mill-m3, valor aún muy inferior a los 13 mill-m3 que es su promedio histórico para este mes y a los 12 mill-m3 que acumulaba a igual fecha el año pasado.

Los embalses del Norte Chico presentan casi todos almacenamientos superiores a los promedios históricos a la fecha, con la sola excepción del embalse Cogotí que almacena la mitad del volumen promedio histórico. En todo caso, el sistema Paloma tiene en conjunto un almacenamiento algo superior al valor histórico de agosto asegurando recursos hídricos para las próximas temporadas de riego.

El embalse El Yeso, de la Región Metropolitana, acumula 157 mill.m3, valor algo inferior al promedio histórico a la fecha y bastante inferior a lo que acumulaba a igual fecha del año pasado.

El embalse Rapel dispone de 408 mill-m3, valor inferior a los 527 mill-m3 correspondientes a su promedio histórico a la fecha y bastante menor a los 622 mill-m3 de agosto del año pasado.

En la Región VII, el embalse Colbún ha mantenido su recuperación, iniciada en el mes de julio, aumentando su volumen en 140 mill-m3 con respecto al del mes anterior, almacenando ahora 652 mill-m3. El promedio histórico de agosto en este embalse es de 1180 mill-m3. En la zona alta, Laguna del Maule aún mantiene un volumen de 1151 mill-m3, valor superior a los 939 mill-m3 promedio del mes de agosto, situación que constituye una reserva importante de agua en la cuenca, ya sea para riego como para hidroelectricidad.

Más al sur, el Lago Laja dispone de 2190 mill-m3, valor inferior a la disponibilidad a igual fecha del año pasado de 3083 mill-m3. El promedio histórico para el mes de agosto del Lago Laja es de 3367 mill-m3.

Los embalses Ralco y Pangue mantienen prácticamente volúmenes muy similares a los del mes anterior producto de que en la zona las precipitaciones han sido principalmente de tipo nival y aún no comienzan los deshielos. Acumulan a la fecha 413 mill-m3 y 76 mill-m3 respectivamente mientras que a igual fecha del año anterior acumulaban 1068 mill-m3 y 78 mill-m3.

De acuerdo con los Polinomios de Energía con que la CNE calcula la energía almacenada, se puede señalar que los embalses Rapel, Colbún, Lago Laja y Ralco, tomados en conjunto, disponen de una energía almacenada de 3198 GWh, inferior al valor de 5267 GWh a igual fecha del año pasado e inferior en 51 GWh a la almacenada el mes de julio recién pasado. Estos cuatro embalses presentan una situación de menores recursos respecto al 2006, con 39 GWh contra 78 GWh en el Rapel, 230 GWh contra 686 GWh en el embalse Colbún, 2752 GWh contra 3998 en el Lago Laja y 178 GWh contra 505 GWh en el embalse Ralco.

# AGUAS SUBTERRÁNEAS.

Al igual que en los meses anteriores, los acuíferos entre las regiones I y VI, mantienen niveles y fluctuaciones que están dentro de lo normal. Sólo en las cuencas de los ríos San José, Loa Alto, Copiapó y en la zona costera entre los ríos Elqui y Limarí se observa una tendencia a la baja más allá de la fluctuación normal de este parámetro.
